

The Two-Minute Improvement: A Faster Path to Power Change-Over

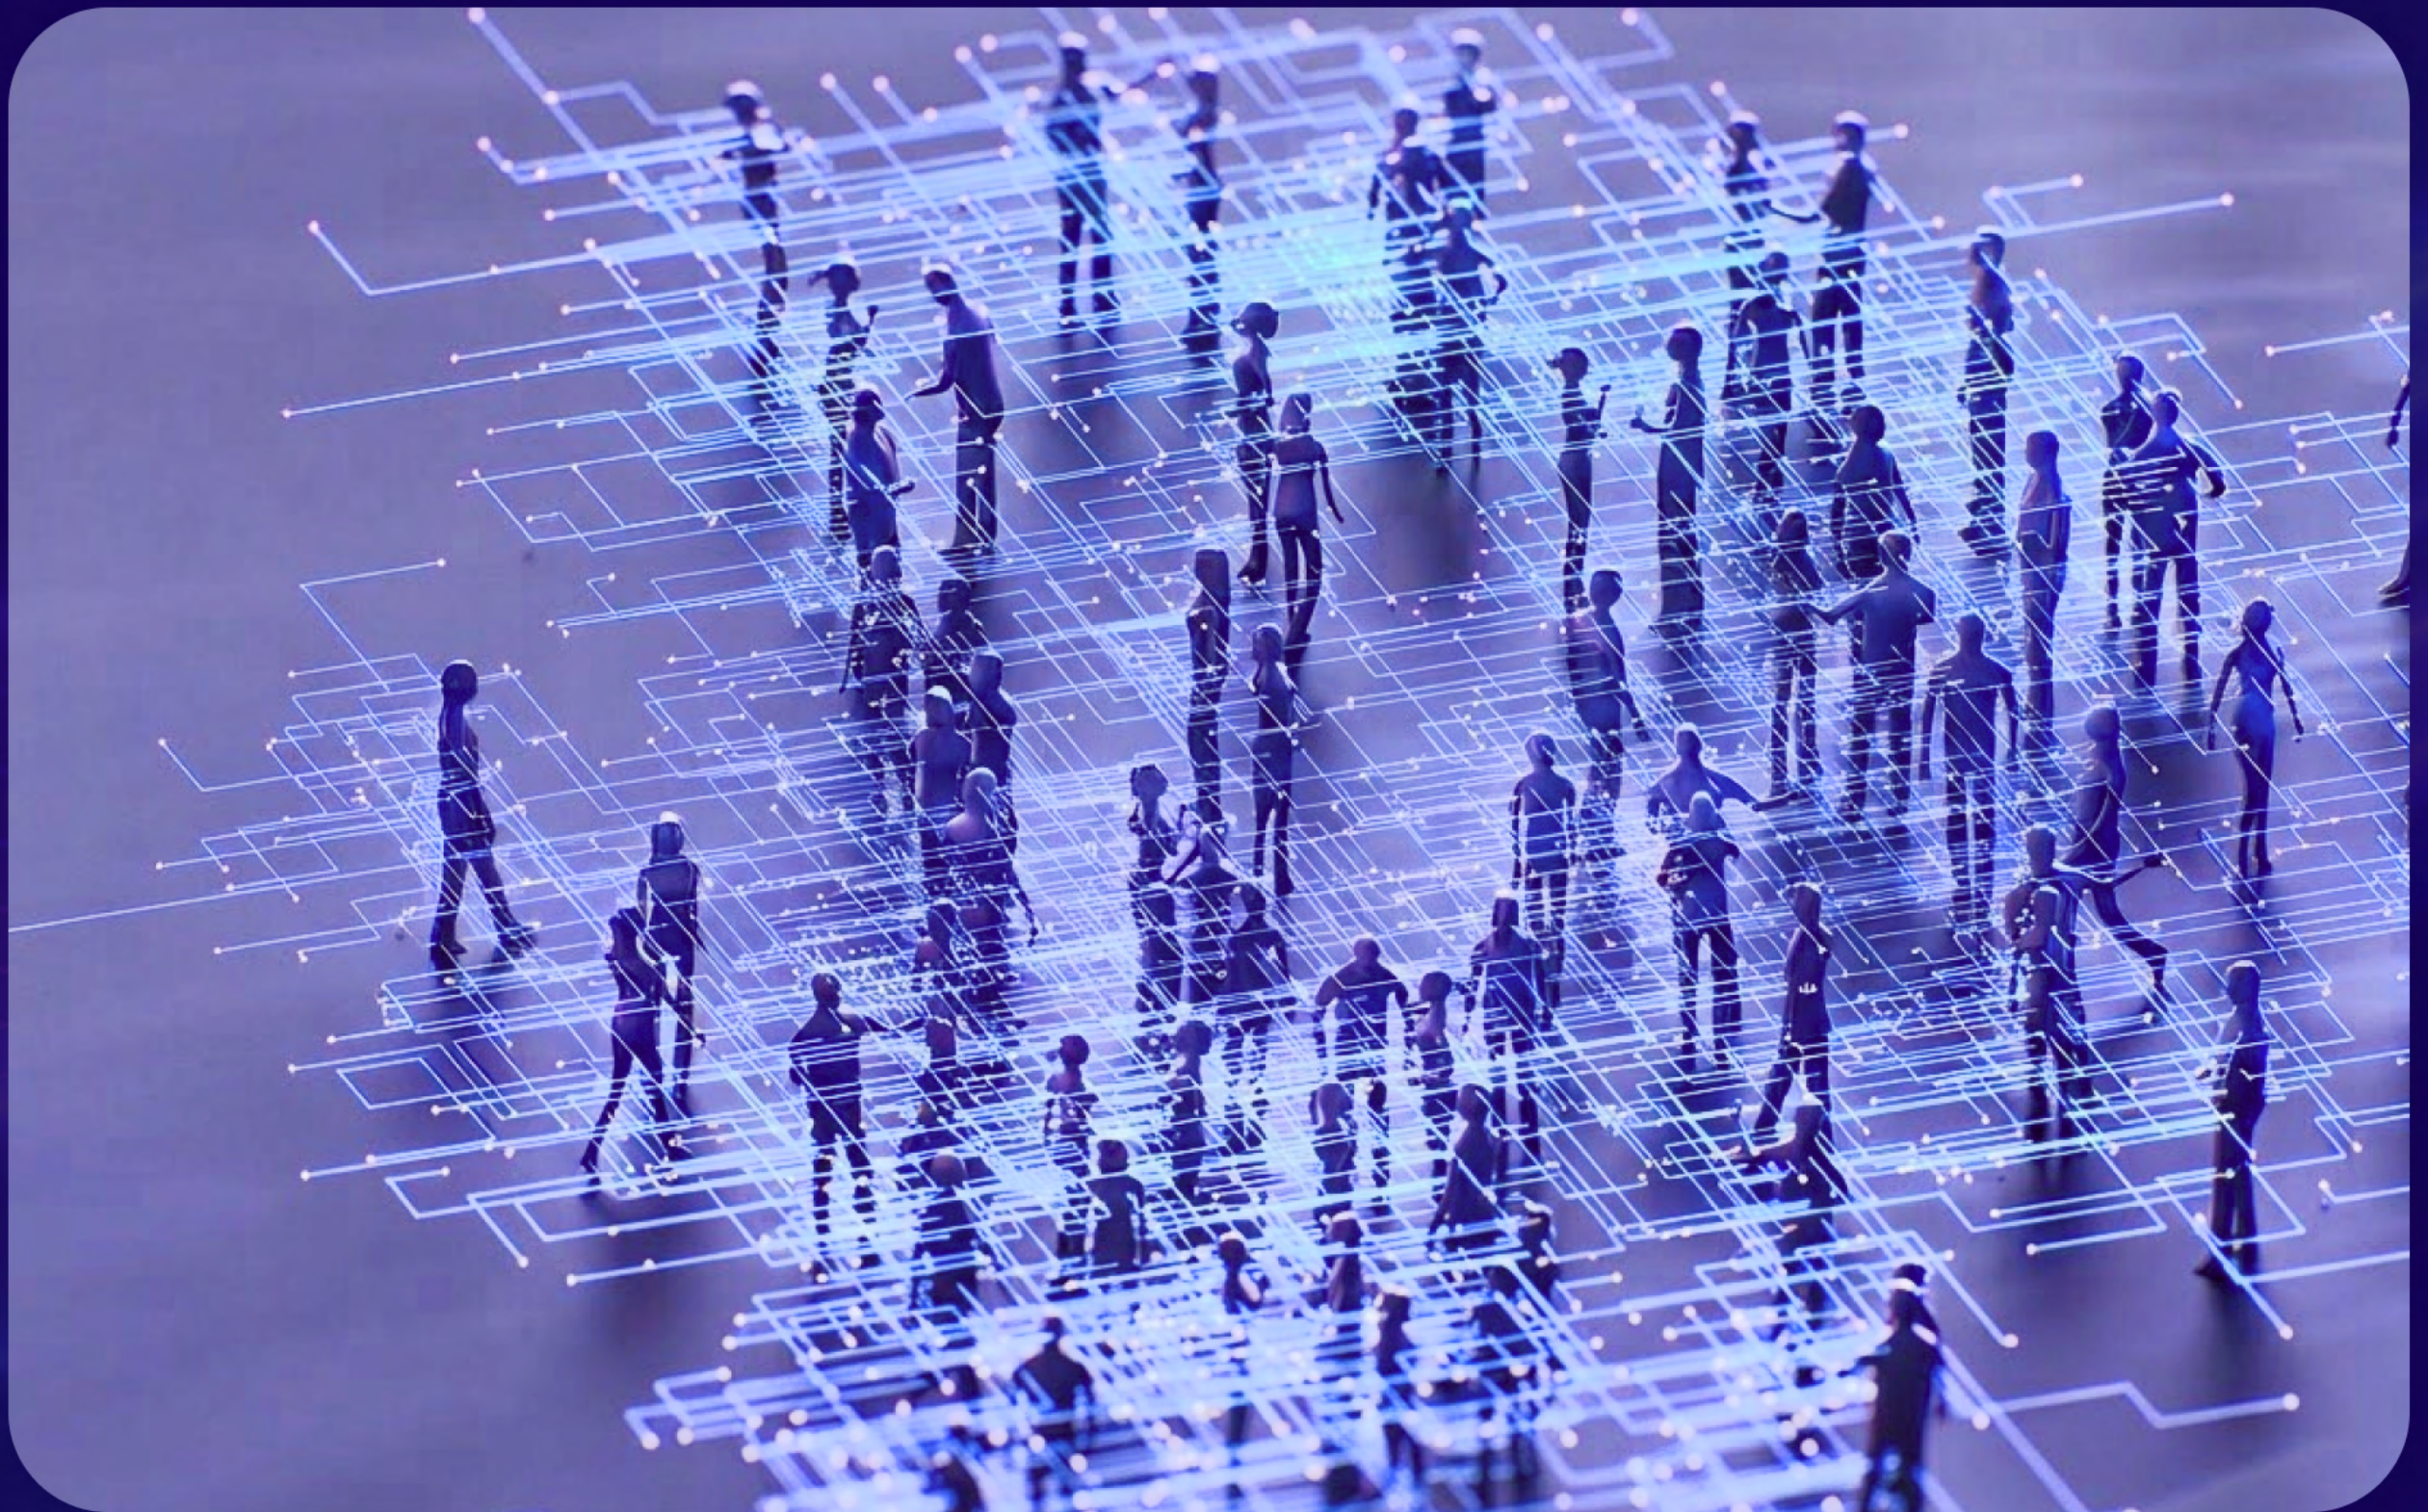

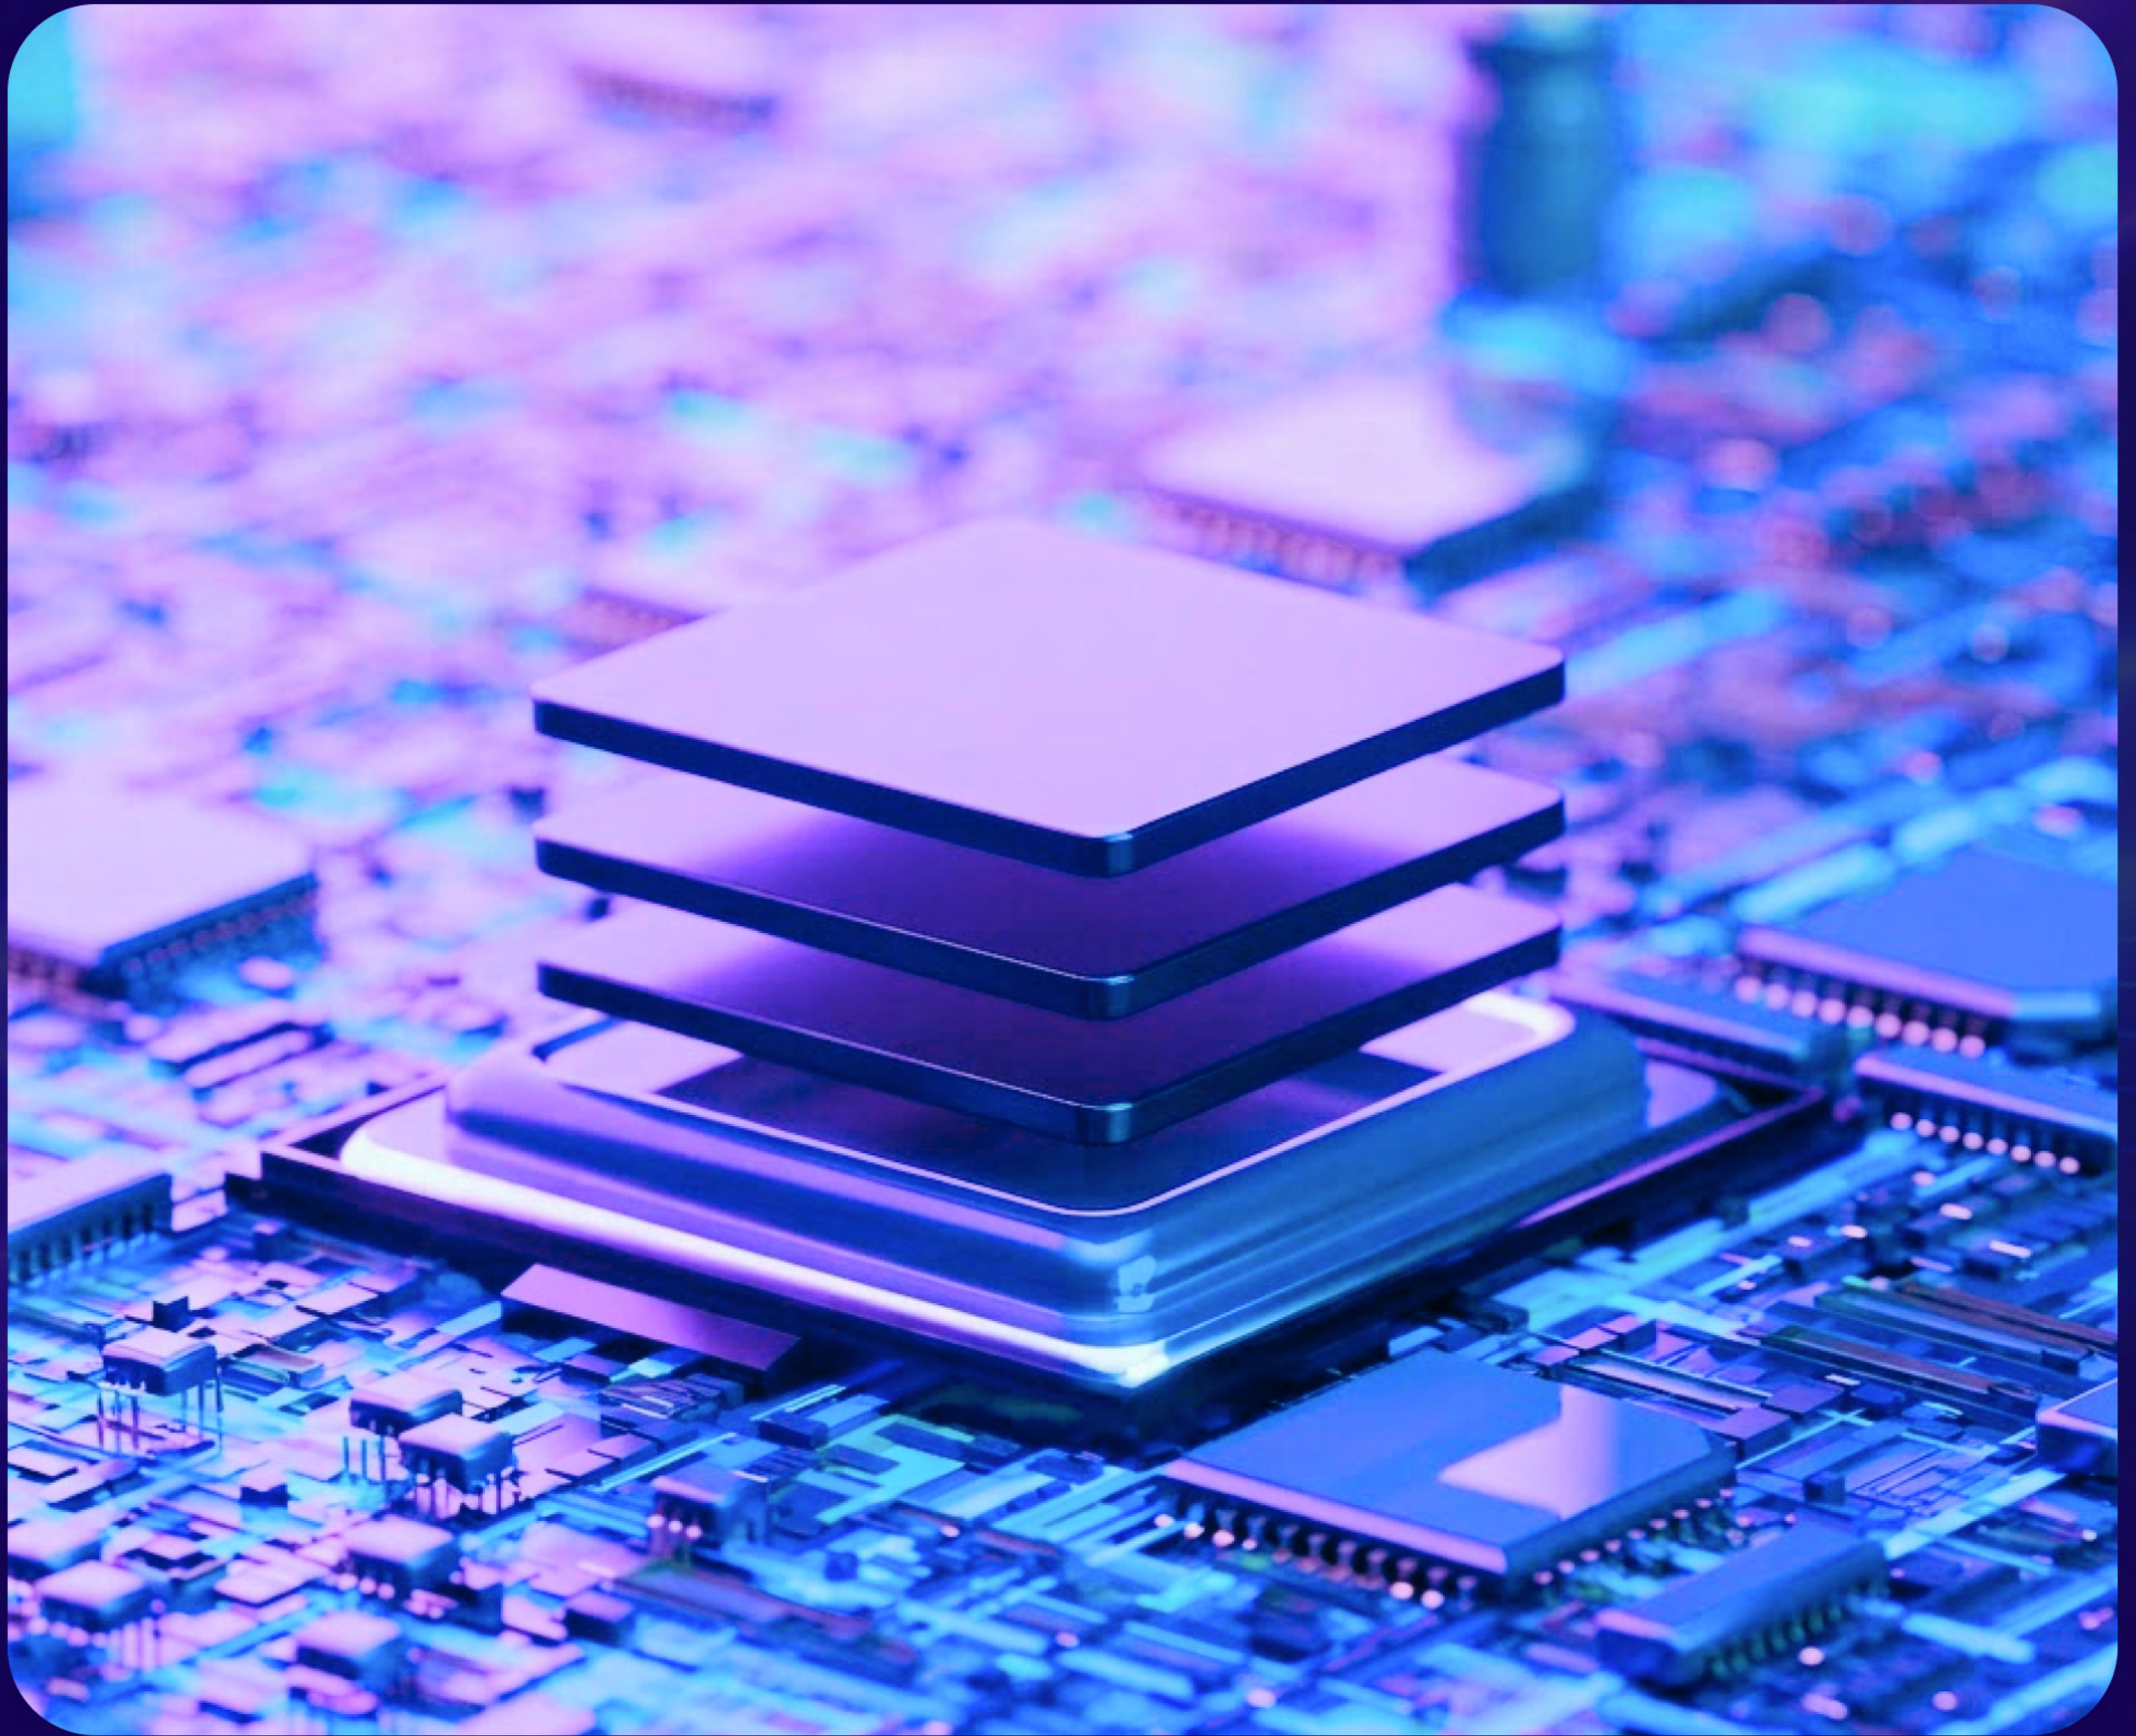

**Backup power switching
traditionally required manual
intervention before equipment
could be safely restored.**

Nxera's Operations team challenged the existing workflow.

They reviewed the operating process,
engineering controls and system capabilities.

The redesigned process enabled safe automated switching via a **Building Management System (BMS)** or **Human-Machine Interface (HMI)**.

**Turnaround fell from approximately
two hours to two minutes.**

**Operational excellence is not
only about following the process.**

Sometimes it is about making
the process better.
